

Create class Doctor with below attributes:

regNo  
doctorName  
specialization  
consultingFee

Create constructor Doctor(regNo, doctorName,specialization,consultingFee)

Declare displayDoctorDetail() method which should return string in the below format:

Doctor Name :<doctorname> Specialization :<specialization>

Example: Doctor Name :Sanjan John Specialization :PEDIATRICIANS

Create a class **DoctorFinderDemo** with main method. Declare doctor object in main method using constructor.

Print doctor name using it getter method and call displayDoctorDetail() and print the doctor detail.

Follow the class outline strictly for method and attributes names.

All attributes are private member , use getter /setter to access these attributes and methods are public.

Create all java classes in package “com” in src folder.
