Create class Item with below attributes:
itemId
itemName
itemPrice
itemDiscount
Create class ItemDemo with main method. Declare array of 5 item objects in main method. Initialize this array. Declare another method in this class – getLeastPriceItem which will take item array as input and return item with least price (considering discount as well). Display item name in main method. Follow class outline diagram as given below. Ensure class attributes are private and other methods are public.

Use package "com" to build your solution.
